**OCCUPATIONAL AIR MOVEMENT AND CONTROL ASSOCIATION INC.**

AMCA certified that the model LE-47 louver shown herein is licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 511 and comply with the requirements of the AMCA Certified Ratings Program. The AMCA Certified Ratings Seal applies to air performance ratings and water penetration ratings.

**LE-47**

Below is an explanation of how to use the AMCA performance data for the recommended free area velocity of 822 fpm (4.17 m/s).

To determine minimum free area required for louver:

**Step #1:** Divide the required CFM flow by the maximum recommended free area velocity.

**Step #2:** Select the most desirable louver size, from the free area table, that meets the minimum free area requirement.

**Step #3:** Compare specified performance to the certified water penetration and pressure drop ratings.

Openings that require multiple louver panels in both width and height will require internal structural supports. It is recommended that large openings be divided with structural members so that the louveres span either width or height with a single panel. Unusually high wind loading may require structural supports on non-multiples wide and multiple high assemblies. Structural supports and mounting accessories are not supplied as a standard.

Example:
Given 15,000 CFM design flow

**Step #1:**
min. free area = \[
\frac{\text{Design CFM}}{\text{Max. Recommended Velocity}}
\]

= \[
\frac{15,000}{822}\]

= 18.25 sq. ft.

**Step #2:** From the free area table above the approximate louver size is 84” x 72” = (22.32 sq. ft.)
