Application
The CBD-150 backdraft damper employs counterbalanced gravity operated extruded style blades to restrict reverse airflow and to permit the forward flow of air in the intended direction. The CBD-150 damper may be mounted vertically or horizontally in either exhaust or intake installations for low to medium velocity and pressure applications.

Standard Construction
Frame: 1-7/8" x 13/16" x 0.081 (46 x 21 x 2) extruded aluminum channel.
Blades: 0.05" (1.3) thick aluminum - extruded.
Linkage: Exposed on blade.
Bearings: Synthetic.
Seals: Extruded vinyl blade edge.
Counterbalances: On blade - adjustable.
Minimum Size: 6" x 9" (152 x 229)
Maximum Size: Single section: 48" x 48" (1219 x 1219)  
Multiple section: Unlimited

Options
- Integral 1-1/2" (38) mounting flange.
- Type B (discharge side)  Type C (intake side)
- Factory installed sleeve:
  - Gauge: 20 (1.0)  16 (1.6)
  - Length: 10" (254)  12" (305)  24" (610)
  - Other_____
- Transitions (sleeve required):
  - Flanged
  - Round AR  Oval AO

Certified Ratings:
Pottorff certifies that the model CBD-150 shown herein is licensed to bear the AMCA seal. The ratings shown are based on test and procedures performed in accordance with AMCA Publication 511 and comply with the requirements of the AMCA Certified Ratings Program. The AMCA Certified Ratings seal applies to air performance.

Leakage: 9.9 cfm/ft² @ 1.0 in. wg. (0.05m³/s/m² @ 0.25 kPa)

Temperature: -40°F to 200°F (-40°C to 93°C)
### Airflow Performance Data

#### Pressure Drop vs. Velocity

![Graph showing pressure drop vs. velocity for a 24" x 24" damper.]

**Certified Ratings:**

Pottorff certifies that the model CBD-150 shown herein is licensed to bear the AMCA seal. The ratings shown are based on test and procedures performed in accordance with AMCA Publication 511 and comply with the requirements of the AMCA Certified Ratings Program. The AMCA Certified Ratings seal applies to air performance.

Pressure drop testing was performed in accordance with AMCA Standard 500-D using the two configurations shown. All data has been corrected to represent air density of 0.075 lb/ft³. Actual pressure drop in any ducted HVAC system is a combination of many elements. This information, along with analysis of other system influences, should be used to estimate actual pressure losses for a damper installed in a given HVAC system.

**NOTE:** Damper blades start to open at 0.01" wg. (2.5 Pa) Damper blades are fully open at 0.15" wg. (38 Pa)

#### Leakage vs. Pressure Drop

![Graph showing leakage vs. pressure drop for a 24" x 24" damper.]

**Ducted Inlet**

AMCA Figure 5.2 Illustrates a ducted damper exhausting air into an open area. This configuration has a lower pressure drop than Figure 5.5 because entrance losses are minimized by a straight duct run upstream of the damper.

**Plenum Mount**

AMCA Figure 5.5 Illustrates a plenum mounted damper. This configuration has the highest pressure drop because of extremely high entrance and exit losses due to the sudden changes of area in the system.

#### Installation

1. Dampers must be installed square and free from racking.

2. When installed in a fan discharge application, the damper should be installed a minimum of 1/2 of the fan diameter dimension away from the fan.

3. Dampers are designed to be self-supporting in the maximum single section size. When dampers are installed in multiple section assemblies, bracing may be required to support the weight of the dampers and to ensure structural integrity against system pressures. It is recommended that multiple sections be appropriately braced. In horizontal installations, it is recommended that suitable supports be installed every 8 feet of damper width. Dampers installed in vertical multiple assemblies and/or higher system pressures, may require additional bracing.

4. See Model BD and CBD Installation Instructions for further installation details.

Information is subject to change without notice or obligation.

**NOTE:** Dimensions in parentheses ( ) are millimeters.
